                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CA2281913-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a method for the protection against infection of a poikilothermic fish by the bacterial pathogen, Pisciriokettsia salmonis. The method comprises administering an immunogenic amount of a salmonis specific antigen termed OspA, or an immunogenic fragment of p. salmonis specific antigen termed OspA, or an immunogenic fragment of p. salmonis poikilothermic fish, against the bacterial pathogen particularly poikilothermic fish, against the bacterial pathogen particularly. The method is also useful for protecting against salmonid p. salmonis. The method is also useful for protecting against salmonid prickettsial septicaemia (SRS) and other rickettsial diseases. The present sequence represents optimised p. salmonis OspA protein 17E2. The DNA sequence represents optimised p. salmonis OspA protein 17E2. The DNA encoding OspA 17E2 (AARB6247) has been optimised for expression in encoding OspA 17E2 (AARB6247) has been optimised for expression in Ecsherichia coli. An OspA protein with an N-terminal fusion partner is Ecsherichia coli. An OspA protein with an N-terminal fusion partner is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Method for protecting poikilothermic fish against salmonid rickettsial septicaemia and other rickettsial diseases comprises administering a vaccine containing the OspA protein of Piscirickettsia salmonis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    17-SEP-1999;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                17-SEP-1999;

The method comprises administering an immunogenic amount of a p. salmonis specific antigen termed OspA, or an immunogenic fragment of OspA in the form of a vaccine. The method is used for protecting animals particularly poikilothermic fish, against the bacterial pathogen p. salmonis. The method is also useful for protecting against salmonid rickettsial septicaemia (SRS) and other rickettsial diseases. The presents P. salmonis OspA protein. An OspA protein with an N-terminal fusion partner is used in a vaccine to create an anti-OspA antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (KAYW/)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to methods and compositions for cross-
CC linking and/or modifying the properties of polysaccharide materials.
CC linking and/or modifying the properties of polysaccharide materials.
CC representation of the polysaccharide structure with a
CC polysaccharide binding domain (PBD) fusion protein. The method is
CC used to alter the structural, chemical, physical, electrical and
CC mechanical properties of polysaccharide materials such as paper,
CC yarns, fibers and textiles, using biological crosslinking agents.
CC The polysaccharide containing materials have improved mechanical
CC properties such as wet strengths, durability and elasticity. The PBD
CC properties such as wet strengths, durability and elasticity. The PBD
CC reagent is applied in the forming stage in fluting paper manufacture
CC which eliminates the sizing step. The use of a biological crosslinker
CC the fine fibers in a slurry therefore resulting in better recovery of
CC the fine fibers in a slurry therefore resulting in better recovery of
CC the phasnose the shillty of the albeliane of the hinding to

The present invention relates to methods and compositions for cross-
Clinking and/or modifying the properties of polysaccharide materials.
Clinking and/or modifying the properties of polysaccharide materials.
Clinking and/or modifying the properties of polysaccharide structure with a
Clinking and involves treating the polysaccharide structure.
Clinking in the structural, chemical, physical, electrical and mechanical properties of polysaccharide materials such as paper,
Clinking in the structural containing biological crosslinking agents.
Clinking in the structural containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD properties such as wet strengths, durability and elasticity. The PBD cragent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker converse the recyclability of paper products. The PBD reagent maintains the fine fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of containing the paper products. The paper maintains conditions contains the paper products of the sine paper maintains the paper products.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polysaccharide modification; polysaccharide binding domain; PBD; yarn; fiber; textile; biological crosslinker; mechanical propert wet strength; durability; elasticity; cellulose binding domain; chimeric protein; S peptide-cellulose binding domain-S protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric S peptide-cellulose binding domain-S protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Misc-difference

The method is used to alter the structural, chemical, physical, electrical and mechanical properties of polysaccharide meterials such as paper, The polysaccharide. Such as paper, and textiles, using biological crosslinking agents. The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker improves the recyclability of paper products. The PBD reagent maintains the fine fibers in a slurry therefore resulting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is Clostridium cellulovorans cellulose binding domain (CBD) cross linker protein (CCP).

Note: This sequence is stated to be the same as that shown as SEQ ID NO: 6 in the sequence listing of the specification. However this sequence has an additional residue at its C-terminal.

AAQ72917/R63634 is a novel isolated cellulose binding domain. It pref. binds crystalline with a Kd ranging from 1.5 microM. On 5.5 microM, compression with a Kd of <1.2 microM, esp. <1.0 microM. The protein and compression by the encoding DNA are claimed, as is a CBD fusion protein (FP) pref. Comprising the CBD and a second protein. The second protein is pref. Comprising the CBD and a second protein. The second protein of degrading C protein A, heparinase, a hormone or an enzyme capable of degrading C an environmental pollutant, or an HSP, HSP antibody, cross-reactive HSP-related protein or an antigenic portion of this. The CBD and FP C may be used in drug delivery, affinity sepns, and diagnostic may be used in drug delivery, affinity sepns, and diagnostic cources that produce CBDs that bind with high affinity and in a C sources that produce CBDs that bind with high affinity and in a C source of CBD encoding nucleic acid is C. cellulovorans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δÕ

The present invention relates to methods and compositions for cross-cc linking and/or modifylng the properties of polysaccharide materials. CC Inking and/or modifylng the properties of polysaccharide materials. CC polysaccharide binding domain (PBD) fusion protein The method is CC polysaccharide binding domain (PBD) fusion protein The method is CC mechanical properties of polysaccharide materials such as paper. CC warns, fibers and textiles, using biological crosslinking agents. CC yarns, fibers and textiles, using biological crosslinking agents. CC yarns, fibers and textiles, using biological crosslinking agents. CC properties such as wet strengths, durability and elasticity. The PBD CC properties such as wet strengths, durability and elasticity. The PBD CC improves the recyclability of paper products. The pBD reagent maintains composed the fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of the fine fibers in a slurry therefore resulting in better recovery of compositions the pBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δõ

                                                                                                                                                                                                                                                                                             polysaccharide binding domain (PBD) fusion protein. The method is used to alter the structural, chemical, physical, electrical and mechanical properties of polysaccharide materials such as paper, yarns, fibers and textiles, using biological crosslinking agents. The polysaccharide containing materials have improved mechanical properties such as wet strengths, durability and elasticity. The PBD reagent is applied in the forming stage in fluting paper manufacture which eliminates the sizing step. The use of a biological crosslinker improves the recyclability of paper products. The PBD reagent maintains the fibers in a slurry therefore resulting in better recovery of raw materials. The PBD molecules are eluted by strong alkaline conditions which enhances the ability of the alkaline glue used in binding to
                                                                                                                                                                                                binding domain (ProtA-CBD). This sequence contains a part of CBP A protein and a part of protein A derived from PRIT2T vector sequence Note: This sequence is stated to be the same as that shown as SEQ ID NO: 8 in the sequence listing of the specification. However this sequence has 2 additional residues at its C-terminal.

                                                                            bioluminescence-generating systems, assays, screening methods, diagnostic method and articles of manufacture. They can be expressed using e.g. bacterial, yeast, fungal, plant, insect or animal cells. The Renilla mulleri, Gaussia and Pleuromamma luciferase or Renilla or Ptilosarcus GIPs can be used in e.g. toys, cosmetics, fountains, personal care items, fairy dust, beverages, soft drinks, foods, textile products, bubble bath, ink or paper products. In particular, they can be used in e.g. squirt guns, pellet guns, finger paints, foot bags, greeting cards, slimy play material, clothing, bubble making toys, bath powders, cosmetics, body lotions, gels, body powders, body creams, toothpastes, mouthwashes, soaps, body paints, bubble bath, inks, wrapping paper, gelatins, icings, frostings, greeting cards, beer, wine, champagne, soft drinks, ice cubes, received fished plants. The nucleic acids can also be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (PROL-)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                bioluminescence-generating system; toy; cosmetic; fairy dust; beverage; body paint; squirt gun; balloon; slimy play material; soap; toothpaste; fusion protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    US5856201-A.
                                                                                     This sequence represents a cellulose binding domain (CBD) derived from the CbpA protein of Clostridium cellulovorans. The sequence is used the construction of a fusion protein which can be used in diagnostic construction of a fusion protein which can be used in diagnostic immunoassays, e.g. to detect heat-shock proteins (HSP) and their cross-reactive proteins, antigenic fragments or HSP-specific antibodies cross-reactive proteins, antigenic fragments or HSP-specific antibodies (which indicate insulin-dependent diabetes mellitus, or susceptibility (which indicate insulin-dependent diabetes mellitus) but to it. The CBD, has very high affinity for cellulose (including to it. The CBD) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   27-OCT-1994;
                                                                                                                                                                                                                                                                              This sequence represents a fusion protein (CBD-KpnI) composed of the Cbp protein cellulose binding domain (CBD) from Clostridium cellulovorans protein is used in diagnostic immunoassays, e.g. to detect heat-shock proteins (HSP) and their cross reactive proteins, antigenic freatments or HSP-specific antibodies (which indicate insulin-dependent diabetes mellitus, or susceptibility to it. The CBD has very high affinity for cellulose (including crystalline forms) and chitin affinity for cellulose (including crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but has almost no cellulolytic or amorphogenic activities. The CBD binds over a wide pH range and is not amorphogenic activities. The CBD binds over a wide pH range and is not

                                                                                                                                                                                                         shock protein (HSP) fragment. This protein is used in diagnostic immunoassays, e.g. to detect heat-shock proteins (HSP) and their cross-reactive proteins, antigenic fragments or HSP-specific antibodies (which indicate insulin-dependent diabetes mellitus, or susceptibility to it. The CBD has very high affinity for cellulose (including crystalline forms) and chitin (dissociation constant 0.8-1.4 mu M), but has almost no cellulolytic or amorphogenic activities. The CBD binds over
                                                                                                                                                                                                                                                                                          This sequence represents a fusion protein composed of the CbpA protein cellulose binding domain (CBD) from Clostridium cellulovorans and a heat shock protein (HSP) fragment. This protein is used in diagnostic

IS Microbiol. Lett. 78:181-186(1992).

IS Microbiol. Acts As A SCAFFOLDING PROTEIN IN THE CELLULOSOME. IT FUNCTION: ACTS AS A SCAFFOLDING PROTEIN IN THE CELLULOSOME. IT PROMOTES BINDING OF CELLULOSE TO THE CATALYTIC DOMAINS OF THE CELLULOLYTIC ENZYMES PROBABLY THROUGH THE BINDING OF THE NINE REPEATED DOMAINS WITH THE DUPLICATED SEGMENT OF 24 AMINO ACIDS PRESENT IN CATALYTIC SUBUNITS OF THE CELLULOSOME.
                                                                                                                                                                                                                        281
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBCELLULAR LOCATION: CELL SURFACE. SIMILARITY: A 24 RESIDUES DOMAIN IS REPEATED TWICE IN THIS ENZYME.
